Word Breaks Across Consonant Clusters in Gothic
A Data Base on Excel[1]

This data base on Excel presents a tally of the word breaks across internuclear consonant clusters in the following fragments of Ulfilas' Bible translation into Gothic, as transcribed and edited by Uppström (1854-1868): the *Codex Argenteus* and the *Codices Gotici Ambrosiani,* as well as the fragments of the *Skeireins aiwaggeljons þairh iohannen* (*Commentary on the Gospel of John*) as transcribed, edited, and translated by Bennett (1960). It also includes the one word with a divided internuclear cluster in the "New Leaf" of the *Argenteus* as transcribed, edited, and translated by Szemerényi (1972).

The motivation for this tally is to make these data available electronically. It is also motivated by the fact that the sources now available presenting a tally of such word breaks are incomplete. For example, Hermann 1923:287f lists 394 cases of heterosyllabified two-segment glide-final clusters (i.e., VC/GV) in the Gothic mss. Yet the Excel data set comprising just these three editions (plus a single word from the *Argenteus* New Leaf) exhibits 409 such breaks.

As has long been recognized, at the end of lines the Gothic scribes regularly divided internuclear clusters before the last consonant of the cluster (e.g., *Arg*: Word 2, *garaih/teins*, Mt 5:20) except in the case of stops (*P*) and *θ (þ)* followed by liquids, in which case they divided before the obstruent (e.g., *Arg:* Word 85, *sti/kla*, Mt 10:42; Word 3, *maur/þreiþ*, Mt 5:21) . These regular breaks are tallied in the first two columns of the data base. Any deviations from this practice are noted as "Early Breaks" (third column) or "Late Breaks" (final column). In the case of word-initial vowels followed by a liquid-final cluster, the scribes usually deviated from the above practice by dividing between the obstruent and the liquid rather than before the obstruent—apparently in order to avoid beginning a line with a stranded vowel (see Vennemann 1987:180). In such cases I have placed a parenthetic asterisk after the entry, e.g., *Amb. A*: Word 168, *ïd/reigondane* (*), (2 Cor 12:21).

On the right side of the Excel sheets I have noted breaks before cluster-final glides as well as deviations from this practice (so-called "errors"). The occurrence of the morpheme *ïz/w*- ending with a tautosyllabified glide is so frequent that it has its own separate tally (Column 5). The total number of breaks before glides terminating internuclear clusters (i.e., VC$_{1-n}$ / GV) is the sum of Columns 4 – 6. The total number of breaks before or within such clusters is the sum of Columns 4 – 7. The rationale for such a detailed tally of divided glide final clusters stems from the fact that much controversy surrounds the significance of such divisions. (See for example, Barrack: "Sievers' Law in Gothic: a response to Pierce" (2010).)

Since the scribes regularly divided at morpheme boundaries separating prefixes from stems, such breaks often deviate from the above practice and are not included in the data base (e.g., *Arg*: John 6:17 *at/iddja*; John 6:58 *at/staig*). Because of the possibility that the first element of compounds may also be divided on the basis of morphological rather than phonological principles, they too have been excluded from this tally. (On scribal practices in word division, see Schulze 1908:618.)

In order to facilitate electronic searches of this data base for those researchers lacking special font sets, I have rendered initial *ï* in Gothic simply as *i*, *þ* (i.e., *thorn*) as *t'*, and the voiceless labiovelar glottal fricative *h^w* as *h'*.

Note

> Uppström renders the labio-velar glide as *v* and its voiceless counterpart as *w*. In the Excel data base I have followed the more common practice of rendering the former as *w*, and the latter as *h'* for reasons expressed above.
